BOOKBETTER × ROTTERDAM THE HAGUE AIRPORT

Booking partnership — impact report

First four months after go-live · 1 July – 31 October 2026 · bookings made through the RTHA booking engine

Prepared for RTHA Strategy, Sustainability & Innovation
Prepared by BookBetter · November 2026

Illustrative data — synthetic dataset for a case study

CO_2e AVOIDED THROUGH SAF

215 tonnes

8.9% of the 2,417 t emitted by these flights, funded by travellers at checkout and delivered via Book & Claim.

Bookings via RTHA engine
3,753
7,601 passengers · 2.09% session-to-booking

SAF uptake (share of bookings)
75.0%
▲ 7.7 pp July → October

SAF funded
107,733 L
€215,466 in traveller contributions

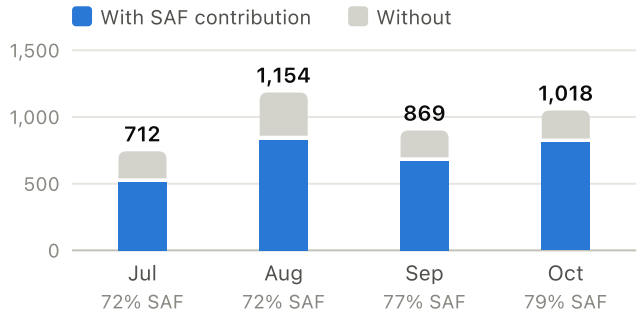

Gross booking value
€1.74M
€43,610 partner revenue share (2.5%)

Repeat bookings
12.5%
3,285 unique travellers

SAF certificates issued
1,871
sent after the last flight of each trip

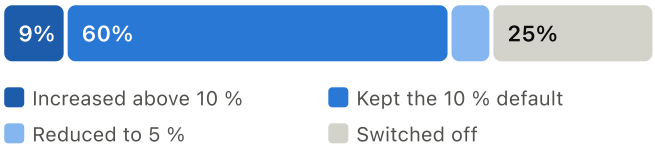

Bookings per month, with and without a SAF contribution

Summer peak in August; the share with SAF grows every month.

What travellers did with the 10 % default

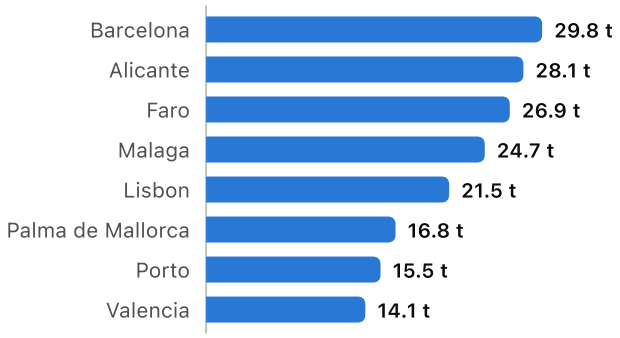

Share of 3,753 bookings. The default is pre-selected; travellers can raise, lower or switch it off.

Opt-out fell from **28%** in July to **21%** in October. Where SAF was kept on, travellers covered **11.8%** of their emissions on average and paid **€77** per booking.

CO_2e avoided by route

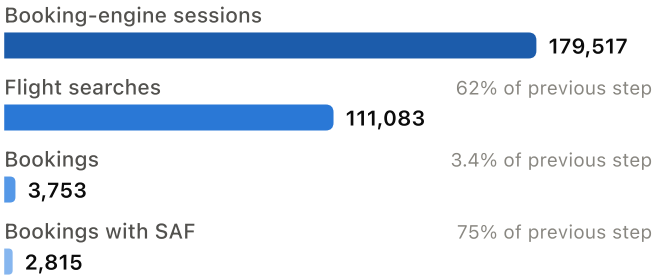

Top 8 of 12 routes, tonnes. Long leisure routes carry the impact.

The other four routes add **38.1 t**. London City is a top-4 route by volume (**392** bookings) but, at 320 km, avoids only **6.3 t**.

From airport visitor to SAF funder

Booking-engine funnel for the whole period.

Uptake is the same on mobile (**75%**) and desktop (**75%**): the default works regardless of device.

What this means for RTHA

- **The default does the work.** 69% of travellers kept or raised the pre-selected 10 % contribution; only 25% switched it off, and that share is falling.
- **Sustainability is now measurable per route.** 107,733 litres of SAF and 215 t CO_2e, each backed by a certificate — figures RTHA can report publicly.
- **The engine pays for itself.** €1.74M booked and €43,610 in revenue share, with 1 in 8 bookings already from a returning traveller.

Proposed next quarter

1. **Test a 15 % default** on the five Iberian routes, where uptake is highest — an A/B test on conversion and opt-out.
2. **Make certificates shareable** (1,871 issued): a "my flight was flown on SAF" moment for social and for RTHA's own channels.
3. **Show rail next to London City flights:** the shortest route avoids the least CO_2e per booking; a train option keeps the sustainable choice honest.

Method. All figures are computed from a synthetic dataset (3,753 bookings) created for this case study — no real RTHA or BookBetter data. Emissions: 0.12–0.17 kg CO_2e per passenger-km by distance band. SAF: supplied via Book & Claim, 2.0 kg CO_2e avoided per litre (~80 % lifecycle reduction), travellers pay the €2.00/L price gap. Partner revenue share of 2.5 % is illustrative. Source code and data: github.com/slvtveter/bookbetter-rtha-impact-report
