Illustrative data · case study

In four months, RTHA travellers funded 107,733 litres of sustainable aviation fuel and avoided 215 tonnes of CO_2e.

Impact report · July – October 2026 · Prepared for RTHA Strategy, Sustainability & Innovation

SUSTAINABILITY

215 t CO_2e

avoided — 8.9% of what these flights emitted

107,733 L of SAF via Book & Claim
1,871 SAF certificates issued

COMMERCIAL

€1.74M

booked — 3,753 bookings, 7,601 passengers

€43,610 revenue share to RTHA
2.09% session-to-booking, 12.5% repeat

ADOPTION

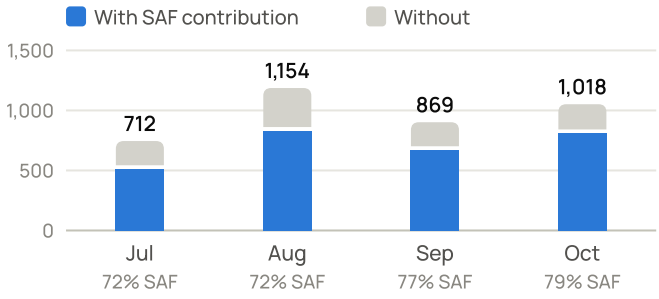

75%

of bookings include a SAF contribution

▲ 7.7 pp from July to October
€215,466 contributed by travellers

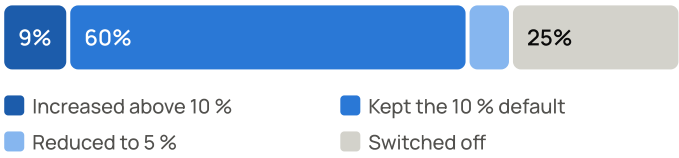

Uptake held through the summer peak and rose in autumn

Bookings through the RTHA engine, split by whether a SAF contribution was included: 72% in July, 79% in October.

The pre-selected 10 % does the work: 69% kept or raised it

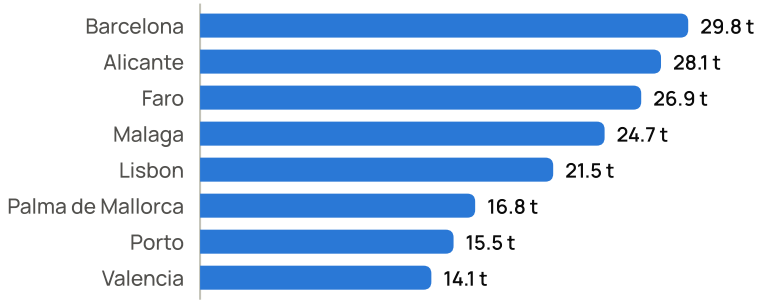

What travellers did with the default contribution. Opt-out fell from 28% in July to 21% in October.

Where SAF was kept on, travellers covered **11.8%** of their emissions on average. Uptake was identical on mobile and desktop (**75%**), so the default, not the device, drives it. Average contribution where kept on: **€77** per booking.

Long leisure routes carry the impact

CO_2e avoided by destination, tonnes, top 8 of 12 routes.

Five Iberian routes — Barcelona, Alicante, Faro, Málaga, Lisbon — account for **61%** of all CO_2e avoided.

London City is a top-4 route by volume (392 bookings) but, at 320 km, avoids only **6.3 t**: short routes are where a rail option matters.

PROPOSED FOR NEXT QUARTER

01

Test a 15 % default

A/B test on the five Iberian routes, where uptake is highest; track conversion and opt-out.

02

Make certificates shareable

1,871 issued so far: a "my flight ran on SAF" moment for travellers and RTHA's channels.

03

Show rail next to London City

The shortest route avoids the least CO_2e; a rail option keeps the sustainable choice honest.

Method. All figures come from a synthetic dataset of 3,753 bookings built for this case study, not from real RTHA or BookBetter data. Emissions 0.12–0.17 kg CO_2e per passenger-km by distance; SAF via Book & Claim, 2.0 kg CO_2e avoided per litre (~80% lifecycle reduction), travellers pay the €2.00/L price gap; 2.5% revenue share is illustrative.
